Stay on top of your mobile data usage.

Wandera

verizon✓

When you have a vast mobile workforce that's always on the go, one of the biggest challenges you face is making sure your employees—and your budgets—stay on track. When employees use a work device for personal reasons, it can be harmful to their productivity. Roaming charges and data-hungry apps can cause your costs to unexpectedly soar. If you don't have the ability to see what's driving your company's data use, you can't properly manage your mobile data budgets or the productivity of your remote team.

Many businesses rely on enterprise mobility management (EMM) platforms and security information event management (SIEM) systems to help streamline their mobile device operations. But without insights into data usage, you're left with an incomplete picture. Wandera helps bridge that gap by helping you see, understand and control your mobile data usage on both cellular and Wi-Fi networks from a single portal.

By providing analytics on both aggregate and individual mobile data use, Wandera gives you unprecedented control over how you manage and allocate your data. You can use these analytics to design effective policies and controls that help keep your business protected and productive. For instance, you can create an intelligent cap for your employees' data to cut down

on unnecessary usage without being overly restrictive. These caps are customizable, so if you have employees that require more frequent travel, they can have a higher cap than those employees who don't travel as far or as often.

With Wandera, you have the ability to create a content security policy that will block and prevent phishing, malware, shadow IT and promiscuous use across your mobile workforce. You can also use Wandera to block websites and apps that are non-work related, that tend to eat up a lot of data or that don't adhere to corporate policies for social media sites or video streaming services. Wandera can even compress content, resulting in lower overall data usage.

Deployment should always be this easy.

Wandera is designed to take the stress out of deployment. It works with and supports most operating systems and original equipment manufacturers (OEMs), as well as integrates with most EMM platforms. This means you can use your current EMM tools to seamlessly deploy Wandera to all of your company's mobile devices.

With Wandera, you'll get unprecedented control over the visibility and management of your mobile data across both cellular and Wi-Fi networks.

These same capabilities also let you create bidirectional policies, taking advantage of the strengths of both your EMM platform and Wandera. For instance, if an employee is in a roaming market and tethering a device, the issue can escalate in Wandera and then your EMM could automatically deactivate the tethering to save data charges.

Make Wandera part of your mobile architecture.

Here's how it works:

- The Wandera application is installed on employee phones, giving employees insights into their own data usage.

- When any employee accesses internet content from a Wandera-enabled device, its data is sent to Wandera's web gateway for mobile.
- Administrators can access Wandera gateway reporting from the web-based management console.
- Administrators can also use the console to filter, block and cap the ways a device is used.

With this level of insight and control into how your remote devices are being used, you don't have to get caught off guard by unpredictable mobile data use and cost spikes again.

Wandera works with most existing operating systems and OEMs, and easily integrates with EMM platforms for a more seamless deployment experience.
