

# When you get device security and management in one easy-to-use package, you're ready.

**Asavie Moda helps you protect mobile devices from internet-borne cyberthreats while enforcing usage policies.**

**With multiple types of mobile devices in use within an organization, keeping them secure can be a challenge. Often, there's little visibility into how employees are using devices, not to mention the possibility of internet-borne threats that could enter your network through an unsecured device.**

Asavie Moda® is a network-based solution that helps you manage mobile security, productivity and compliance for all your devices, including smartphones, tablets and wireless routers. It helps you protect the network and mobile devices against potential cyberattacks by removing corporate traffic from the public internet.

Asavie Moda also supports internal mobile policies and data-protection regulations by applying user-defined rules on all your SIM-enabled devices. Plus, you can set up Asavie Moda quickly and easily, and it works with the leading unified endpoint management (UEM) solutions, giving you a multilayer defense and mobility management solution to help protect your network and devices.

## Solution overview

The Asavie Moda solution gives you greater visibility into all data traffic across all mobile devices, so you can be more proactive in protecting your organization from cyberattacks. By protecting data in transit on mobile devices, you'll be able to enjoy the benefits of mobility, while helping to control costs. The solution delivers a powerful, easy-to-use tool that allows you to define, deploy and enforce internal usage policies that help protect both sensitive business data and employees' personal information.

And Asavie Moda helps you keep mobile employees productive by enabling them to easily access the business-critical apps they need to work effectively. You can also apply employee-specific policies to manage what individuals can and can't do online.

## Solution features

To help protect your organization from potential cyberthreats, Asavie Moda uses a combination of SIM-based policy settings and network analysis for three-tier mobile defense:

### Threat prevention

Asavie Moda includes advanced threat-intelligence features that actively block compromised websites and malicious content at the source. That gives you zero-day defense against potential malware, spyware and phishing attacks. The solution uses machine learning to fight potential mobile threats by constantly analyzing over 500 million user behaviors and hundreds of millions of websites per day to help identify potential attackers.

## Compliance

Like most organizations, you probably have internal policies that employees must comply with when using their mobile devices. Asavie Moda can help you enforce these policies across the entire organization. The solution filters over 1 billion websites via a manageable user interface that sorts sites by 26 categories and 165 subcategories, for organizations requiring granular detail.

## Device security and mobile data loss prevention

If a mobile device is lost or stolen, you no longer have to worry about a possible data breach. Asavie Moda protects against such breaches by enabling deployment of critical mobile device management (MDM) features, like password protection, remote lock, and lock and wipe, as part of a defense-in-depth security strategy. The solution also delivers seamless security measures across cellular and Wi-Fi networks, so devices stay protected even outside your organizational firewall.

## With Verizon and Asavie, you're ready.
