

Are you experiencing weak, unreliable in-building coverage?

Use case

Together, Verizon and a WilsonPro cellular-signal amplification solution may be able to help.

Challenges

With smartphones and tablets driving how we communicate, there's no room for spotty cellular coverage. When faced with unreliable, weak or limited in-building coverage, you may see frustrated employees and tenants, a decline in productivity or issues with tenant retention.

Benefits

Your WilsonPro cellular-signal amplification solution can be up and running quickly, so you can focus on your business instead of your coverage. The solution is carrier agnostic and doesn't require intensive installation.* You don't have to upgrade to potentially costly technologies or switch to a different provider.

Solution

A WilsonPro™ cellular-signal amplification solution is a cost-effective option that businesses of all sizes with spotty indoor coverage can leverage to boost their cell signal quickly and reliably. This solution can amplify existing cell signals and distribute a more reliable connection to phones and other portable devices.
