

Manage your assets remotely.

Use case

Challenges

The way we work is changing. To maintain an increasingly mobile pace while remaining highly productive, your employees rely on mobile devices, collaborative cloud apps and flexible connectivity. But with an increased portfolio of mobile devices comes increased security vulnerabilities. Finding a way to enable seamless access to existing systems while protecting vital assets is now a priority for many businesses.

Solutions

Solink is an easy-to-use solution that provides insight into the metrics affecting operations. Solink's dashboard can provide you with insight into every cash transaction by integrating your video surveillance with many of your existing data systems, including key cards, vault codes and sensors.

Without the need to grant system access, you're able to share moments of suspicious activity with internal team members and law enforcement—all through Solink's cloud-based dashboard. And the solution enables your business to search for video using data such as time stamps, employee names and even transactional data.

Benefits

With Solink, your business can align surveillance video with predetermined filters to narrow down any outlying transactions, irregular variances or unauthorized access based on department or branch location.

These filters can then red-flag moments of concern and alert the appropriate team so that you can monitor situations as they unfold. Solink also helps management identify employees who need better training for certain procedures.

For an added layer of security, the movement detection and movement alert feature allows your business to set notifications so that unauthorized access to vaults or other restricted areas is flagged instantly.
